Arctic Change – Indigenous Life and Scientific Tracks in Sakha/Russia

STILLS

[...]

Sakha, as the app. two million inhabitants of the Russian Republic of Yakutia call their country, is a region underlain with permafrost. This means that humans live on a soil that has temperatures of less than 0 °C up to a depth of 1,600 m. The global consequences of the permafrost soil thawing because of global warming have not yet been studied in their entirety, but they are irreversible. For generations, the struggle for life of the Sakhas, Evens, Evenkis and other Indigenous peoples of the North has been determined by extremes, with temperatures below minus 50 °C during winter and above plus 40 °C during summer. Illustrated lectures and film screenings will focus on the rapidly changing living conditions caused by global warming.

With: Torsten Sachs (climate scientist), Csaba Mészáros (anthropologist), Vyacheslav Shadrin (Chief of the Council of Yukaghir Elders), Sardana Savvina (film producer), Marcus Stiglegger (film scholar), Klaus Grosfeld (REKLIM), Renate

2017
